

Vinci Eval Integrity 0.1

1

Identity and independence

Exact artifact, model, task-family, and statistical unit

2

Contract clarity

Prompt, tests, and reference agree on every scored behaviour

3

Channel separation

Visible runtime checks cannot become the hidden score

4

Bidirectional discrimination

Wrong programs fail; valid alternatives pass

5

Estimand integrity

Censoring, denominators, retention, and units are explicit

6

Production-path binding

The executed authority is the authority named in provenance

7

Power and requalification

Simulate the exact rule; use an independent post-repair population

Any failed or unverified check blocks “qualified evaluator” language for model selection, optimization, release, or product claims.
